

AUTOMATED NIFTY 50 • RULE-BASED • AUDITABLE

Consistency, engineered — not big wins, gambled.

An automated Nifty 50 trading system covering weekly options and a disciplined intraday-futures engine. Every trade is rule-based, repeatable, and sized to your risk — and it doesn't stop at entry: positions monitor themselves and exit by rule.

- Weekly options spreads
- Intraday futures engine
- Self-monitoring exits
- Nothing is a black box

DIRECTION	STRENGTH	CONFIDENCE	GUARDRAIL
Bullish bias from five evidence tiers	Mild how decisively evidence leans	High tier agreement, volatility-adjusted	Watching VIX extreme volatility halts trading

THE PRINCIPLE

Built to be understood, line by line.

Every signal, trade, and exit traces back to the exact inputs and simple maths behind it — figures you can re-derive yourself. The edge is discipline, not opacity.

Rule-based & repeatable

The same inputs always produce the same decision. No discretion, no mood — deterministic behaviour you can audit and trust.

Sized to your risk

Position size is set so a realistic bad outcome stays inside a small, fixed slice of your capital — decided before the trade, never after.

Fully re-derivable

No float-point fudge, no hidden model. Precision arithmetic throughout and a complete audit trail from signal to settled P&L.

HOW A DIRECTION IS DECIDED

Five tiers of evidence, one weighted verdict.

Each tier casts a simple bullish / neutral / bearish vote. Some tiers carry more weight than others. Their weighted result becomes your bias, strength, and confidence.

TIER 01				
Price structure	Where price sits against its moving averages, trend of highs and lows, put-call balance, and max-pain.	CORE WEIGHT	+ 0 -	
TIER 02				
Technical indicators	Moving-average crossovers, RSI, MACD and candlestick patterns – the classic trend and momentum reads.	STRONG	+ 0 -	
TIER 03				
Institutional flow	Where the big money moves – foreign and domestic institutional buying and selling across futures, options and cash.	CORE WEIGHT	+ 0 -	
TIER 04				
Volatility & macro	The direction of volatility, open-interest shifts, and the overnight global lead from GIFT Nifty.	CONTEXT	+ 0 -	
TIER 05				
Commentary & news	News sentiment and – when you provide it – your own market view, read into a structured signal.	CONTEXT	+ 0 -	
→ Weighted composite		BIAS	STRENGTH	CONFIDENCE
		Bullish	Mild	High

Confidence bends with volatility. Calm markets lift conviction; stressed markets dampen it. When volatility turns **extreme, the system refuses to auto-trade** – it flags the situation to you instead of guessing.

FROM DIRECTION TO TRADE

A direction only becomes a trade if it survives the gauntlet.

The bias is turned into a specific options spread, then forced through four quality gates. Fail any hard gate and the trade is rejected — standing aside is a valid outcome.

STEP 01

Pick the strategy

Chosen from your bias, the volatility regime, and how richly options are priced.

STEP 02

Map the move

Estimate how far the market can realistically travel by expiry — cross-checked two ways.

STEP 03

Select strikes

Sell beyond that likely range, with a defined-risk spread around it.

STEP 04

Size the position

Lots set so a realistic loss stays within a fixed slice of capital.

GATE 01

Probability of profit

A genuine, Black-Scholes-derived chance of finishing in profit — not a hopeful guess.

HARD GATE

GATE 02

Loss stays contained

A realistic worst case must fit inside a small, fixed slice of your capital — this sizes the trade.

SIZING GATE

GATE 03

Internally consistent

The trade's own probability measures must agree with each other before it's allowed through.

HARD GATE

GATE 04

Worth the capital

The expected return must clear a threshold scaled to how long the trade is held.

HARD GATE

Clear every gate → a sized trade card. Fail one → rejected, with the reason shown.

AFTER ENTRY

The trade watches itself.

A live position is never place-and-forget. It's re-checked on a schedule through the session, and each check picks one of four actions — with exit levels that tighten as expiry approaches.

ACTION Hold The trade is behaving. Nothing to do — keep letting time work in its favour.	ACTION Watch The market is approaching a level of interest. Probability is re-checked more closely.	ACTION Readjust Pressure is building. The position can be rolled or tightened to defend it.	ACTION Exit A defence line is breached. All legs are closed — decisively, by rule.
Volatility spike → immediate exit A sharp intraday jump in volatility forces the position closed regardless of price.	Extreme volatility → pause & alert When conditions turn extreme, automated monitoring pauses and hands the decision to you.		

A SEPARATE DISCIPLINE

The intraday futures engine.

A standalone Nifty-futures strategy: intraday only, hard stop-loss, no overnight risk. It runs twice around the open — a primed plan first, then a confirmation of which setup is actually live.

Yesterday's range draws a ladder of reference levels (the Camarilla method). Around them sits a grid of four disciplined setups — **bias picks the side, confidence sets how aggressively, and a compression check can veto the trade entirely.**

LONG

Rotation

Reclaim the floor and fade back toward the middle of the range.

SHORT

Rotation

Reject the cap and fade back down through the range.

LONG

Breakout

Accept above the upper band and run with the move.

SHORT

Breakdown

Lose the lower band and ride the break lower.

+ **Trigger, never anticipation.** A trade is placed only when price actually reaches the level and confirms — no chasing.

⚡ **Stop and target, set upfront.** Every trade carries both a hard stop-loss and a profit target from the moment it's placed.

↗ **Flat by the close.** No overnight exposure — the engine squares off within the session, every day.

CONTROL & VERIFICATION

Three ways the system keeps you in command.

Audit

Every trade is recorded end to end — the signal that started it, the trade built, the fills paid, and every check that followed.

- How often the approach wins
- How much of the possible profit it kept
- Whether the signal was actually right

Critical alerts

Whenever the system can't be certain your position is safe, it stops and shows the full picture rather than guessing.

- An order leg didn't fill — the other is auto-closed
- An exit couldn't complete, or fills came in worse than expected
- Each alert stays until you acknowledge it

Simulation

Replay a full multi-day trade in minutes against saved market data — touching no live market and placing no real orders.

- The whole flow runs: signal, trade, monitoring, exit
- Verify exactly how a setup behaves
- Tweak the scenario and re-run "what-ifs" before trusting it live

A system you can **interrogate**, not just obey.

Rule-based signals, defined-risk trades, self-monitoring exits, and a full audit trail — so every outcome traces back to inputs you can check yourself. That's the whole pitch: consistency you can verify.

For evaluation and discussion. ZuppTrade is an automated trading assistant for Nifty 50 options and index futures. Trading in equity derivatives carries substantial risk of loss and is not suitable for every investor; past or simulated performance is not indicative of future results. Nothing here is investment advice. Figures shown are illustrative of the system's logic, not live quotes or a performance record.
